Cur

It has been postulated that antibodies specific to the hypervariable region I (HVRI) within the putative envelop probein E2 of hepatitis of virus (HCV) can neutralize virus. We studied such antibodies in sera of patients who were infected in a single-source outhreak by a contaminated anti-D immunoglobulin preparation (HCV-AD78). The nucleofide sequences of DDMs encoding HVRI of HCV-AD78 were determined. The four matter a Bacherichta coll. Sixty-seven expressed as fusion professed to HVRI.A, B, C, and D) were expected as fusion professed to HVRI.A. Sera unrelated to expected a losser infection of the outbreak also recognized HVRI.A but to a lesser infection of the outbreak also recognized HVRI.A but to a lesser extent (15°), suggesting that not all HVRI-specific antibodies are absolutely isolate-specific. Antibodies directed against individual variants of HVRI were found in sera obtained searly postinfection (p.i.) (< or = 1 year) but also in sera obtained several years (p.i.) (< or = 1 year) but also in sera obtained several years (p.i.) (< or = 1 year) but also in sera obtained several years

employed to further characterize these sera. Five of seven sera that were obtained early p.i. prevented binding of HCV to cells. Preincubation of such sera with HVR1-specific fusion proteins restored binding of HCV to cells in four of five sera. These findings suggest that the majority of neutralizing antibodies are directed against HVR1.

Mean 8.010; Variance 4.828; scale 1.659 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Example 21. Fig 41, 34pp, English.
The present sequence is the variable kappa chain gene segment the present sequence is the variable kappa chain gene segment vectaining human DNA fragment, vk65.3, which was co-injected along with the human DNA fragments vk65.5, vk67.8 and vk65.15 into half day mouse embryo pronoclei, to generate an unrearranged light chain minilocus transgene. The resulting transgenic mice can be used for the production of heterologous (1.e. human) antibodies against specific antigens, this comprises immunising a mouse with a human gamma immunigabulins.
                                            14-APR-1997 (first entry)

DNA fragment vk65.3, containing variable kappa chain gene.

Variable: kappa chain; gene segment; human; DNA fragment; vk65.3;

unrearranged, light chain; minilocus; transgene, transgenic; mouse;

Production, heterologous; antibody; gamma, immunoglobulin, ss.

Homo sapiens.

The V-kappa specific cluyeous extribe 760.67 was used to probe a human placental genomic for library cloued into lambdaEMEL/SP6/T7.

ENA fragments containing V-kappa segments from positive plage clones were subclosed into plasmid vectors. Variable gene segments
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transgenic non-human animals contq. immunoglobulin heavy chain trans gene — used to produce useful antibodies by isotype

The resulting transgenic mice can be used for the production of heterologous (i.e. human) antibodies against specific antigens, this comprises immunising a mouse with a preselected antigen and collecting antigen binding heterologous Sequence 900 BF; 225 A; 244 C; 204 G; 227 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              14-ApR-1997 (first entry)

DNA fragment vk65.5, containing variable kappa chain gene.

DNA fragment, vk65.5;

Variable, kappa chain, gene segment; human; DNA fragment; vk65.5;

unrearranged; light chain; minilocus; transgene; transgenic; mouse;

production; heterologous; antibody; gamma; immunoglobulin; ss.
from the resulting cloues were sequenced and functional clones were selected on the basis of open reading frames, intact donor and acceptor splice sites and intact recombination sequences. The sequences obtained from four different plasmid clones were designated p55.3, p65.5, p65.8 and p65.15 (see Q44222-Q44225, respectively).
                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of heterologous human immunoglobulin(s) - by immunising

The leader peptide and the L'V region are encoded in different reading frames. The L'V region corresponds to the last three amino acids of the leader peptide and the rearranged VJ gene. Clone 4B9-Vk15 (see Q11878) encodes an aberrant light chain containing two such L'V regions.

These with just a single copy of the L'V region. The clone is not complete; it starts with the G of the AIG initiator codon See also 01879 and 01887. 383 C; 302 G; 266 T;

contains constant kappa and lämbda type regions, and versatile region recognising psacruginosa R4 and H1 types begon the pages 510-511 129ps Japanese. It also codes for a variable region recognising Ps.aeruginosa F4 and H1 types. The Ab can be used for immunologic control of infection caused by Ps.aeruginosa. The antibody is made effective against various classes or subclasses of resistant Ps aeruginosa by recombining corresp DNA L-chain

Disclosure: fig. 3: 17pp; Japanese.

This encodes a variable chain and can be connected to a gene encoding a constant region which determines optional IgG subclass. This can be used to study subclasses, and as an antigen for prepg. IgGl or IgG3 antibod; Regions 32s-372 connected to 560-571 encode the L chain, region 572-856 encodes V chain and region 857-895 encodes J chain. Sequence 1011 BP; 237 A; 263 C; 254 G; 257 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   584 acgcagictocaggcaccetgictitgictccagggggaagagccaccetetetgcagg 643

Example 1; Page 180-186; 49ypp; English.

Cr his sequence represents the pcomb3 phagemid expression vector. This cyclor has been designed to allow for anchoring of expressed proteins on the bacteriophage coat protein. Fill (cp3), which is expressed the 406 residue minor phage coat protein, cp111 (cp3), which is expressed the 406 residue minor phage coat protein, cp111 (cp3), which is expressed coat protein, cp111 (cp3), which is expressed the 406 residue minor phage coat protein, cp111 (cp3), which is expressed and accumulates on the inner membrane lacing into the peripisan of E. and accumulates on the inner membrane lacing into the peripisan of E. and accumulates on the inner membrane lacing into the peripisan of express coil. This plasmid was used within the scope of the Invention of combinatorial Fab libraries. Prownboard for the relating forms of the Fabs. The vector was designed for the cloning and soluble forms of the Fabs. The vector was designed for the cloning two cassettes to express one fusion protein, Ed/cp3, and one soluble forms of the fabs. The finished vector comprises, operatively protein, the light chain. The finished vector comprises, operatively correction still first cassette consisting of lac2 promoter/operator regions a spacer region, a cloning region bordered by 5 xhol and sequences. A spacer region, a cloning region bordered by 5 xhol and second lac2 promoter/operator sequence. Sequence the two cassettes, and a second lac2 promoter/operator sequence. Collowed by an expression control RBS, a PalB leader, a spacer region. Still and 3 xbal restriction site. The pcomb3 expression vector lorms the basic constitution sites, the pcomb3 expression vector lorms the basic constitution sites. Collowed by a stop codon, a page of 10 minor sequences and a second lac2 promoter/operator regions between the two cassettes, and a second lac2 promoter/operator regions. Collowed by a stop codon and a second lac2 promoter/operator region between the two cassettes, and a second lac2 promoter/operator regions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            of the MT4 Fab display phagemid expression vector, pMT4-3 (see also 092540), used in the invention for the production of synthetic human Fub antibodies against 9pl20 of HIV.

This sequence represents the expression vector, poho-TT which is a modified version of the phagemid expression vector, pcomb3 given in 20256. pphorTT provides for the expression vector, pcomb3 given in 20256. pphorTT provides for the expression vector, pcomb1 are secreted into the periplasmic space which is regulated from the alkaline phosphatase (phoA) promoter This plasmid was used within the scope of the invention to express various mutagenised human Fab's which comprise the unvention to express various mutagenised human Fab's which comprise the avey and light variable regions which bind to HIV gpl20. pcho-TI consists of a DNA molecule having two cassettes to express two soluble promoter/operator sequence, an affect chain. The vector comprises promoter/operator sequence, an affect chain. The vector comprises promoter/operator sequence, an affect cassette consisting of the phoA promoter/operator sequence, an affect restriction site, a rubesome binding site (RBS), an CmpA leader, a Sfil restriction site, a number of sites, an Nool restriction site between the two cassettes, and a second cassette consisting of an expression central stop sequences and a Notle sequence such a not set of sites, and a second consense and mother chain stuffer that is 1200 by in length and a heavy chain stuffer that is 1200 by in length and a heavy and light chains tube heavy and light chains tube heavy and light chains to the heavy and light chains to the consistion of a channer to the control of a person contains of a channer to the control of an expression control sequences and a not a channer to the control of a person control of a person contains a light.

diversity antibody libraries, for screening antiques of disk antibody libraries, for screening antiques antibody libraries, for screening antiques antibody libraries, for screening antiques against tender sequence represents the light chain coding sequence derived from the surface display phagement of the light chain variable domains sequences for encoding human feath antibodies against teranus toxin. This sequence was pref. used in the method of the invention for the production of antibody libraries containing increased diversity. The sequences queen in 100480-06 are primers which were used for inducing mutagenesis in a complementary determining region (CDR) of an immorglobulin light chain gene. These primers contain a 3' terminus capable of hybridising to a first framework region and a nucleotide sequence between the 5' and 3' termini having the formula [NNR]n, when the CDR regions of immorglobulins heavy or light chains that the libraries with increased antibody diversity by inducing mutagenesis within the CDR regions of immorglobulins heavy or light chains that the library. These primers filementary by the contain of the library. These primers filements within the library. These primers filements within the library. These primers filements which contain CDR3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              novel immunospecificities and affinities. By using mutagonic ONs an extremely large population of different landomised binding sites can be created and use of the universal light chain increases the number of combinations which yield functional heterodimeric antibodies sequence 646 BP; 162 A; 187 C; 170 G; 127 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       1 gageteaggeagtetecaggeaccetgtettgtetecaggggaaagageaccetece 60
